

清 Breeze

Lavender, Rosemary, White Orchid

Breeze through a day with deep breaths of soothing Lavender, woody-herbal Rosemary, and fragrant White Orchid.

華 Glow

Osmanthus, Rose, Violet

Set hearts aglow with an exquisite blend of lovely Damask Rose, delicate Osmanthus and rich Violet.

A multi-purpose spray

Use it anytime, anywhere

Pamper yourself with unique scents

Enjoy living in touch with nature

Expression

Expression is a cold pressed method of extraction. It presses the fruit, seed or skin to extract the essential oil. It is mostly used in the extraction of essential oils from citrus plants such as orange, lemon, lime and grapefruit.

Supercritical Fluid Extraction (SFE)

SFE is one of the most advanced extraction techniques. It uses carbon dioxide as a supercritical fluid (carbon dioxide has excellent solvent properties at certain temperature and pressure) to extract, separate and purify, and hence obtain essential oils of high purity. Essential oils obtained through SFE do not have added harmful solvents. They are safe, non-toxic, natural and have a more genuine aroma of the actual herb, spice or plant than an essential oil obtained by distillation. Such essential oils are highly concentrated, extremely pure, and very precious. It takes 1,500 to 2,500 kilograms of roses to extract one kilogram of essential oil.

Supercritical Fluid—Carbon Dioxide

Carbon dioxide is a gas at standard pressure and temperature. It becomes a supercritical fluid above 31.3 degrees Celsius and 72.9 atm pressure. A supercritical fluid is neither a gas nor a liquid but has the properties of both; it can diffuse through solids like a gas and dissolve materials like a liquid. Supercritical carbon dioxide is an excellent solvent to use in the extraction of essential oils as it is safe, non-toxic and inert. As carbon dioxide returns to its gaseous state under normal temperature and pressure, it enters the atmosphere and is safe, non-toxic and environmentally benign.

Essential Oils ~ Life's Affordable Little Luxuries

Essential oils are volatile and liquid aroma compounds distilled from the flowers, leaves or fruits of plants. When inhaled, the natural aroma of essential oils travels through the olfactory nerve to the brain, and stimulates the brain to secrete endorphins and enkephalins, thereby producing a relaxing effect.

Each essential oil is made up of 50 to 500 different molecules. Nature has arranged these molecules in perfect ratios that work in synergy such that every type of plant is unique and yields different benefits for the human body.

Advanced Extraction Technologies

Distillation

Most pure essential oils are extracted from plants through steam distillation. Hot steam helps to release aromatic molecules from plant material. These molecules evaporate into the steam. The steam is cooled rapidly to condense it back into a liquid from which the essential oil and water is then separated. This fragrant water is called hydrosol.

Floral and Fruity Essence Spray with a Refreshing Aqua Texture

Aqua Essence Pampers You with Nature's Best Scents

Aqua Essence is an array of delightful fruity and floral scents. Its light yet lasting scents are blended from precious essential oils and hydrosol from steam distillation.

Grapefruit, Lily of the Valley, Jasmine

Fresh and pure like morning dew, this gentle fragrance blended from uplifting Grapefruit, sweet Lily of the Valley, and floral Jasmine exudes quiet elegance.

Bergamot, Apple, Jasmine

Immerse in a delicious concoction of zesty Bergamot, sweet Apple and heady Jasmine, like a happy stroll through a sun-kissed forest!
